### **Installation instructions for Double Wall pipe connector**

Whenever you install Dura Vent chimney system's interior pipe you must use a Close Clearance connector which is a short stainless steel connector union which needs the larger side of it connected into the ceiling support box and the smaller size to the dvl interior pipe. Make sure that you install the [Close Clearance Connector - also known as DVL/DuraBlack Chimney Adaptor](#) properly to your chimney system. This one part may need special attention if you are installing it to another brand of chimney system. The larger side of this connector needs to fit inside the hole in the support box with the inner liner of the chimney system inside of this connector. Sometimes the opening has to be slightly enlarged to get the connector to fit inside of the hole. Tapping the inner opening in the support box with a ball peen hammer or other tool can make the opening slightly larger for this to be done. This connector must be installed before the support box is installed in the ceiling to avoid dismantling to install this part.
